Module 1

1. Write a python program to find the second-largest element in a list.
2. Write a python program to Remove duplicate elements from a list.
3. Write a python program to Find the frequency of elements in a list.
4. Write a python program to Convert a tuple into a list and modify it.
5. Write a python program to find the common elements in two tuples.
6. Write a Python program to reverse a list and tuple without using the built-in reverse() method.
7. Write a Python program to reverse a given string.
8. A cricket player scored the following runs in five matches: 45, 67, 32, 89 and 56. Write a Python program to store the scores in a list and calculate the total, average and highest score.

6. Student Management System

1. Write a Python program to create a dictionary containing the roll number, name and marks of five students. Display all student details.

2. Find the student who scored the highest marks.

3.Display students who scored more than 50 marks.

4.Calculate and display the total and average marks of each student.

5.Search for a student by roll number in a dictionary and display their details.

6.Convert two lists into a dictionary.

7.Employee Management System

1. Create a dictionary containing employee IDs and their salaries. Display the employee who receives the highest salary.

2. Write a Python program to store employee names and salaries in a dictionary. Increase the salary of each employee by 10%

3. Create a dictionary containing employee IDs and names. Add a new employee, update an existing employee's details and delete an employee.

4. Write a Python program to calculate the total salary expenditure of a company using a dictionary.

5.Merge two dictionaries.

1. Develop a menu-driven Python program to add, display, search and append student records using file handling.

2. Store employee details in a file. Read the records, calculate salary statistics and save the salary report in another file.

3. Create a program to add book details in a file, display all books, search for a book and append new book records.

4. Write a program to read a text file and calculate the number of lines, words, characters, vowels and word frequencies.

5. Store deposit and withdrawal transactions in a file. Read the transactions and calculate the final balance.

6. Write a Python program to read a file and remove all blank lines. Store the result in a new file.
