I/O Streams and File Streams

1. **FileInputStream – Reading a File**
   Write a Java program to read the contents of a text file named input.txt using FileInputStream and display the contents on the console. Handle possible exceptions appropriately and ensure that the stream is closed after reading.

2. **FileOutputStream – Writing to a File**
   Write a Java program that accepts a string from the user and writes it into a file named output.txt using FileOutputStream. If the file already exists, append the new content without deleting the existing data.

3. **DataInputStream and DataOutputStream**
   Write a Java program to store the details of a student—such as roll number, name, and marks—in a file using DataOutputStream. Then, read the same data from the file using DataInputStream and display the student details.

4. **BufferedInputStream and BufferedOutputStream**
   Write a Java program to copy the contents of one file into another using BufferedInputStream and BufferedOutputStream.

5. **Combined File and Data Stream Application**
   Develop a Java program for a simple employee record system. Accept employee ID, name, and salary from the user and store the details in a file using DataOutputStream. Read and display all stored employee details using DataInputStream. Use appropriate exception handling and stream-closing mechanisms.
