Java Applets – Lab Practice Questions

1. **Demonstrate the Applet Life Cycle**
   Develop a Java Applet that displays messages indicating when the init(), start(), paint(), stop(), and destroy() methods are executed. Run the applet and observe the order in which these methods are invoked. Write a brief observation explaining the role of each method.

2. **Applet for User Information Display**
   Develop a Java Applet that accepts a student's **name, register number, course, and semester** as parameters and displays the information in a formatted manner. Use the appropriate Applet life-cycle method to initialize the parameters and paint() to display them.

3. **Interactive Applet Using Mouse Events**
   Develop a Java Applet that displays a message such as **"Move the mouse inside the applet"**. When the user clicks at any position, display the **x and y coordinates** of the mouse pointer. Implement the required mouse-event handling methods and explain how the applet life cycle supports the execution of the program.

4. **Applet for Simple Animation**
   Develop a Java Applet that displays a circle moving horizontally across the applet window. Use appropriate life-cycle methods to **initialize the animation, start it, temporarily stop it, and resume it**. Demonstrate the effect of the start() and stop() methods on the animation.

5. **Applet Using HTML Parameters**
   Develop a Java Applet that receives **background color, foreground color, and a message** through parameters specified in an HTML file. Retrieve these parameters in the init() method and display the customized message using paint(). Test the applet with at least **three different sets of parameter values**.
