Java AWT

1. **AWT Components and Layout Managers**
   Develop a Java AWT application for a **Student Registration Form** using Frame, Panel, Label, TextField, Choice, Checkbox, and Button. Use appropriate layout managers to organize the components neatly. The application should include **Submit** and **Clear** buttons and display the entered details when Submit is clicked.

2. **AWT Controls and Event Handling**
   Create a **Simple Calculator** using Java AWT. Use TextField components for input and Button controls for addition, subtraction, multiplication, and division. Implement event handling using ActionListener. Handle invalid input and division-by-zero situations appropriately.

3. **Event Sources, Event Classes and Listeners**
   Develop an AWT-based **Color Selection Application** containing buttons or other suitable controls for selecting different colors. When the user selects a color, change the background color of the Panel or Frame. Identify and use the appropriate **event source, event class, and listener interface** for handling the user actions.

4. **Mouse and Keyboard Events with Adapter Classes**
   Develop an AWT application that displays the **current mouse position** inside a Frame. The application should respond to mouse clicks, mouse movement, and keyboard events. Use appropriate event listener interfaces and demonstrate the use of **adapter classes** to avoid implementing unnecessary listener methods.

5. **Integrated AWT Event-Driven Application**
   Design and implement a **Student Performance Management System** using Java AWT. The interface should contain text fields for student details, controls for entering marks, buttons for calculating total and average, and a suitable component for displaying the result. Use Frame, Panel, appropriate **layout managers**, AWT controls, and event listeners. Include suitable **window-closing event handling using an adapter class**.
